Engineer

Automated GIS SaaS deployment with GitHub Actions

Automated GIS SaaS application deployment, data processing, and reporting system using GitHub Actions CI/CD, Python, Bash, and SQL.

2022 – 2024

deployment, data and reporting, all off the hands

Situation. Getting the GIS SaaS app deployed, processing its data and producing the reports were all manual steps — and manual steps are both slow and quietly dangerous. Every release ate engineering time and carried the chance of a slip, and the recurring data and reporting work sat there eating capacity week after week.

Task. Automating the whole path from code to production, plus the recurring data-processing and reporting, was the task — the goal being releases that were fast, safe and repeatable rather than a careful manual ritual each time.

Action. The whole path got automated. GitHub Actions workflows took over the test-build-deploy cycle, so a release stopped depending on someone remembering the steps. The recurring data processing and the reports moved into scheduled Python, Bash and SQL jobs, so they just ran instead of being someone's chore. And the configuration and secrets were standardised so every environment behaved identically — which is what kills the "works on my machine" surprises, because there stops being a "my machine" that's different from production.

Result. Deployment, data processing and reporting all became automated and reliable, the manual toil came off the team's plate, and the release cycle got shorter. The team could put its attention on the product instead of the operations wrapped around it.

Bring this experience to your project

Use “Automated GIS SaaS deployment with GitHub Actions” as a starting point for a similar challenge in your organisation. The services behind this work are available for your project. Anything that happens in a place — vessels, vehicles, plots, sensors — put on a map you can search, measure and share.

Want to automate your deploys and reporting?

Talk through your project with the engineer responsible for delivery. We agree the scope, price basis and handover in writing before work begins.

Role context: DevOps Engineer. It draws on SQL, Data Engineering, Data Pipelines (ETL/ELT), DevOps, Cloud, Automation & CI/CD, Reliability & Backups, Python and GIS / Geospatial. And while you are here, we are rather good at GIS & Geospatial Solutions, Data Pipeline Development (ETL/ELT) and DevOps & CI/CD Automation.
